

FRP (Fibre Reinforced Plastic)

FRP Translucent Roofing sheets are best chosen material for roofing, where controlled light transmission is required with maximum 90% light transmission as FRP are much stronger and stiffer material which are duly reinforced with glass fibre unlike other plastics and polycarbonate sheets which has no insitu reinforcement material. The corrugated profiles created in FRP is moulded process, whereas in other plastic or polycarbonate sheets is cold bending process which makes all the edges at bending a permanent weak point. Due to this moulded process in FRP Sheet, it gives better flexural rigidity reducing the deflection under high wind velocity and extremes of weather as well as other incidental loads.

We manufacture this product in the most advanced State Of Art continuous production line for manufacturing high transparency sheets and are available in all existing profiles matching to metal roof sheets.

VENTILATORS

We are a trusted source of Turbo Air Ventilators from Vadodara, Gujarat. The Turbo Air Ventilator offered by us, are designed specially by our expert team of engineers keeping in mind the specific as well as the general requirements of our clients. Available in different models with varied specifications to meet and every roofing related need of clients, the sheet metal roofing has been in growing demand in markets across the globe. The premium quality of our products has popularized us as the prime Roofing Sheet Manufacturer & Steel Roofing sheet suppliers from Vadodara.

Pre-Engineered Building (PEB)

Pre engineered building is a steel structure built over a structural concept of primary members, secondary members, and the cover sheeting connected to each other. The structural members are custom designed to be lighter in weight as well as high in strength.

For today and in the future, Steel has become the material of choice in building construction, compared to concrete and timber. Thus steel building designs have become more flexible, durable and adaptable.

Pre Engineered Steel Buildings (PEB) revolutionized the construction market using built-ups in place of conventional Hot Rolled Sections. PEB is a steel structure built over a structural concept of primary members, secondary members, and the cover sheeting connected to each other. The structural members are custom designed to be lighter in weight as well as high in strength. Pre-Engineered Steel Buildings can be fitted with different structural additions like trusses, mezzanine floors, fascias, canopies and crane systems as per user requirements.

Pre-engineered buildings are ideal for use in non residential, wide span low rise buildings. Among the advantages of PEB is low cost, consistent quality control, and fast delivery to name a few. PEB buildings are used for diverse applications such as factories, warehouses, offices, shopping malls, schools, hospitals, community buildings and several more.

As a leading PEB manufacturer Global Roofing provides the complete service of engineering and fabrication thus ensuring better quality control at every stage of the process.
